

SYSTEM, METHOD AND COMPUTER PROGRAM PRODUCT FOR RESTAURANT FOOD COST REPORTING IN A SUPPLY CHAIN

5

ABSTRACT

A system, method and computer program product are disclosed for processed product supply chain reporting wherein a network is utilized to receive data from a plurality of stores of a supply chain. The data includes a first set of information relating to an amount 10 of processed product distributed to the stores and a second set of information relating to the sale of finished product by the stores. The network is also utilized to send the data from the stores to a supply chain manager where a percentage of cost attributable to the processed product is determined using the first and second sets of information for use at the supply chain manager.
